

Diamond offers outstanding results on a variety of tough annual and perennial weeds which include horsetail, bindweed and ragwort. It is a soluble concentrate containing 160g/L 2,4-D + 240g/L glyphosate. For controlling horsetail Diamond is the ideal product this is because it contains glufosinate-ammonium which controls horsetail and all previous products to Diamond are no longer permitted in the UK this makes Diamond an extremely unique product and the perfect one for controlling horsetail. Diamond has been approved for application on: amenity vegetation, orchards, hard surfaces including railway ballast and green cover not being used for crop production. Once applied the 2,4-D will breakdown the leaf tissue which allows the glyphosate to translocate around the plant far quicker and deeper. Diamond will give you complete control to grasses and broad-leaved weeds, Diamond is able to achieve this faster than glyphosate alone as it penetrates deep into the root system swifter.
